                                                                                                                                                                                                                                                             thelamus, mid-brain, medulla, corpus striatum, cerebral cortex and Lestis. The Lag used to identify the source tissue is a string of 3-6 nucleotides present between the Not I site and the oligo-dT track which allows identification of the library of origin of a clone within the mixture. This library was then subtracted using a driver consisting of a mixture of all clones from UI-R-AL, UI-R-ED, UI-R-EL, UI-R-CO, UI-R-C1, UI-R-C2 and UI-R-C2P.

Pools of cells were isolated from a GenomeScreen(TM) library. The

Pools of cells were isolated by retroviral integration of a gene

library of cells was generated by retroviral integration of a gene

tagging element consisting of: 1) A promoterless beta-lactamase

proceeded by a splice acceptor as a reporter for gene expression;

2) A promoter driving neomycin resistance followed by a splice

denor to trap downstream exons. 3' RACE from neomycin gene was

denor to trap downstream exons. 3' RACE from neomycin gene was

portformed using total RNA from isolated pools. Output was shotgun

clared in pamp-1 and used to transform DH5-alpha competent

clared in pamp-1 and used to transform conservations.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC brain. A unique cDNA fragment, designated E51 (see AAV31982), was CC obtain. A unique cDNA fragment, designated E51 (see AAV31982), was CC obtained and used to screen a trisomy 21 human foetal brain (14-wk CC gestation) cDNA library. Further clones were obtained by exon CC trapping. The complete DS-CAM1 cDNA sequence was deduced from CC overlapping clones. A splice variant cDNA (see AAV31983), encoding CC overlapping clones. A splice variant cDNA (see AAV31988), encoding CC overlapping clones. A splice variant cDNA (see AAV31988), encoding CC consensuate bound DS-CAM2 (see AAV42087), w.s also identified. The CC came gene spans 900-1200 kb of genomic DNA and maps at chromosome CC captare. The invention also provides murine DS-CAM partial CC sequences (see AAV31985-87), expression vectors and host cells, CC transgenic animals, antisense oligonuclotides, and primers useful CC for amplification of DS-CAM nucleic acid. DS-CAM polypeptides are associated with developmental and neurological processes. They can be used in e.g. neural prosthetic devices used in entrubulation cc methods of repairing (regenerating) damaged or severed peripheral CC nerves. The products can also be used in detection, diagnosis and CC nerves. The products can also be used in detection, diagnosis and CC therapy of developmental and neurological abnormalities such as CC the corpus callosum, or schizencephaly. Antisense oligonucleotides

destation) chan library. Further, check were obtained by exon CC trapping, and the complete PS CAM2 chan sequence was identified.

CC DS-CAM2 is a splice variant of membrane-bound DS-CAM1 (see AAM42086) CC and is deleted for the entire transmembrane domain. The DS-CAM CC gene spans youl-1200 kb of genomic DNA and maps at chromosome CC 1922.2-22.3. The invention also provides murine DS-CAM partial CC transgenic animals, antisense oligonucleotides, and primers useful CC for amplification of DS-CAM nucleic acid. DS-CAM polypeptides are CC associated with developmental and neurological processes. They can CC methods of repairing (regenerating) damaged or severed peripheral CC nerves. The products can also be used in detection, diagnosis and CC methods of repairing (regenerating) damaged or severed peripheral CC compus callosum, or schizenephaly. Antisense oligonucleotides of the corpus callosum, or schizenephaly. Antisense oligonucleotides CC are used for inhibiting translation of mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 199

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human Down syndrome-cell adhesion molecule DS-CAM2 cDNA.
                                                                                                                                                                                                                                                                                                                                  DS-CAM2 (see AAW42087), an extracellular, soluble protein belonging to a novel subclass of the 1g superfamily with highest homology to neural cell adhesion molecules. A modified direct cDNA selection technique was applied to bacterial and Plartificial chromosomes between ETS2 and MXI by using cDNA from trisomy 21 human foetal brain. A unique cDNA fragment, designated E51 (see AAV31982), was obtained and used to screen a trisomy 21 human foetal brain (14-wk
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DS-CAM2; Down syndrome-cell adhesion molecule:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  28-SEP-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         23-OCT-1997;

```
the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful ingene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, and thrombolytic activity, chemotractic/chemokinetic activity, haemostatic activiny, inhibit activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and constraints.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAV31985
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 schizencephaly; diagnosis; assay; mouse;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    28-SEP-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAV31985
                                                                                                                                                                                                                                    This cDNA sequence comprises the 5' region of a cDNA clone for murine bown syndrome cell adhesion molecule (DS-CAM), a member of a novel subclass of the 1g superfamily with homology to neural cell adhesion molecules. The middle region (see AAV31986) and 3' region (see AAV31987) of the clone are also provided. The murine DS-CAM clone was isolated from a C57 Black/6 mouse brain cDNA library using human DS-CAM clone (see AAV31988) as
                                                    cDNA library using nument by construction (see probe. The invention also provides human DS-CAM proteins (see probe. The invention also provides human DS-CAM proteins (see AMW42086-87), as well as expression vectors and host cells. ARW42086-87), as well as expression vectors and host cells. ARW42086-87), as well as expression vectors and primers useful transgenic animals, antisense oligonucleotides, and primers useful conspicuous description of DS-CAM polypeptides are associated with developmental and neurological processes. They can be used in entubulation be used in entubulation methods of repairing (regenerating) damaged or severed peripheral nerves. The products can also be used in detection, diagnosis and therapy of developmental and neurological abnormalities such as Down syndrome, mental retardation, holoprosencephaly, agenesis of the corpus callosum, or schizencephaly. Antisense oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                            New isolated Down's Syndrome-cell adhesion molecule develop products for detection, diagnosis and therapy developmental and neurological abnormalities

CC brain cDNA using a novel method for identifying genes encoding to movel secreted or membrane-associated proteins. The method comovel secretal (i) liquing a library of cDNA to DNA such as vector comovers (i) liquing a library of cDNA to DNA such as vector comovers (ii) that lacks comovers peptide and membrane anchor sequences (see AAW55047); (ii) comovers and peptide and membrane anchor sequences (see AAW55047); (ii) comovers and comovers (some of) the bacterial clones into mammalian comovers and comovers and (v) identifying a clone in the commandation of the bacterial library, isolating the corresponding clone in the bacterial library, isolating the corresponding clone in the bacterial library, isolating the corresponding clone in the bacterial library, associated (see as a partial cDNA clon of a movel neural addression molecule (see consecutive liquid) and comovel method is very sensitive and is suitable for high throughput consecuting techniques and automation.
                                                                                                                              Q

                                                                                                                                                                                                                                                                                                                                                                                                                                                   murine DS-CAM clone was according to the problem of provides human DS-CAM proteins (see probe. The invention also provides human DS-CAM proteins (see probe. The invention also provides human DS-CAM proteins (see probe. The invention also provides human DS-CAM proteins (see probe. The invention also provides and host cells, transgenic animals, antisense oligonuclocitides, and primers useful transgenic animals, antisense oligonuclocitides, and primers useful for amplification of DS-CAM nucleic acids. DS-CAM polypeptides for amplification of DS-CAM nucleic acids. DS-CAM polypeptides for amplification of DS-CAM nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This CDNA sequence comprises the middle region of a CDNA clone for murine Down syndrome-cell adhesion molecule (DS-CAM), a member of a novel subclass of the 1g superfamily with homology to neural cell adhesion molecules. The 5' region (see AAV31985) and 3' region (see AAV31987) of the clone are also provided. The murine DS-CAM clone was isolated from a C57 Black/6 mouse brain CDNA library using human DS-CAM CDNA (see AAV31981 and AAV31988)
                                                                                                                                                                                                                                                                                                                                             associated with developmental and neurological processes. They can be used in e.g. neural prosthetic devices used in entubulation methods of repairing (remembrating) damaged or severed peripheral nerves. The products can also be used in detection, diagnosis and therapy of developmental and neurological abnormalities such as pown syndrome, mental retardation, holoprosencephaly, agenesis of the corpus callosum, or schizencephaly. Antisense oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated Down's Syndrome-cell adhesion molecule -develop products for detection, diagnosis and therapy developmental and neurological abnormalities

CC for murine Down syndrome-cell adhesion molecule (DS-CAM), a CC member of a novel subclass of the 19 superfamily with homology to CC neural cell adhesion molecules. The middle region (see AAV31986) CC and 5' region (see AAV31985) of the clone are also provided. The CC murine DS-CAM clone was isolated from a C57 Black/6 mouse brain CC cDNA library using human DS-CAM cDNA (see AAV31981) as CC probe. The invention also provides human DS-CAM proteins (see CA AAV42086-87), as well as expression vectors and host cells, CC transgenic animals, antisense oligonucleotides, and primers useful CC associated with developmental and neurological processes. They can CC methods of repairing (regenerating) damaged or severed peripheral CC metros. The products can also be used in detection, diagnosis and CC therapy of developmental and neurological abnormalities such as CC Down syndrome, mental retardation, holoprosencephaly, agenesis of the corpus callosum, or schizencephaly. Antisense oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                   New isolated flown's Syndrome-cell adhesion molecule -develop products for detection, diagnosis and therapy developmental and neurological abnormalities
                                                                                                                                                                                                                                                                                                                                                          Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    25-OCT-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; nootropic; immunosuppressant; cytostatic; gene therapy; cance, peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;
                                                                                                                     The invention relates to human nucleic acids (AA157798-AA161369) and the encoded polypeptides (AAM38642-AAM42213) with mootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as alzheimer's, parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and assays the suppression of the activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              22-OCT-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAI59982;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         applied to bacterial and P1 artificial chromosomes between ETS2 and Mx1. E51 was used as a probe to screen the trisomy 21 foetal brain library. 62 Clones were isolated from the 2 million clones of the original library. Overlapping clones were obtained that were used to deduce a full-length sequence (see AAV31981) coding for novel Down syndrome-cell adhesion molecule DS-CAM1 (see AAW42086). A splice variant, DS-CAM2 (see AAV31988), was also identified. DS-CAM polypeptides are associated with developmental identified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 4605
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    4545
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and neurological processes. The polypeptides and nucleic acids are used to develop products for the detection, diagnosis and therapy of developmental and neurological abnormalities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4665 ctgcgcggagaagcaggcc 4683

The polypeptides may also be used as antiquens in the production of antibodies, and in mayses to identify modulators and inhibitors. Disorders that may be prevented, diagnosed and/or treated by the above methods include, for example immune system disorders, inflammatory disorders, immuno modulation, immune cell stimulation and proliferation, allergic reactions, aberrant cytokine receptor signalling and/or over expression of cytokine responses, cancers, cardiovascular disorders, angiogenic disorders, would healing and requireration, infectious diseases and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence encodes a human cytokine receptor-like protein. The cytokine receptor-like polypeptides and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1;

skin disorders (e.q., psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, angiogenic disorders, kidney disorders, gastrointestinal disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties. Antil odles specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and indiagnostic immunoassays e.g., raijoimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human for the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 29 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic dischers, diseases of the immune system, and the statement of the immune system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammat allergies, neurological disorders (e.g., Alzheimer's disease, Parkinson's disease), cognitive disorders, schizophrenia, asthma, compare disease, schizophrenia, asthma, asth

11-JAN-2000;
The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide comprimertary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 1'-end sequence complementary to a sequence and an oligonucleotide comprises a si'-end sequence where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAH06899;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ААН06899
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   07-FEB-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13639 to AAH18742 represent human cDNA sequences; AAB92446 to AAH13639 represent human amino acid sequences; and AAH13629 to AAH13632 and AAH13630 represent oligonucleotides, all of which are used in the exemplification of the content 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3008 tcaccatguaaggctccccaagaaacatttgcaaaatgggattatccgtggctaccaaatag

                                                                                                                                                                                     Best Local Similarity
                                                                                                                                                                                                                                                                                                   the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises as sequence complementary to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection, and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         02-MAY-2000;
